

Detachable Container for Golf Cart

Abstract of the Disclosure

A detachable container, which is adapted for holding on a golf cart having two inclination arms extending downwardly and outwardly, includes a container frame having
5 a storing chamber, and two container holders spacedly mounted on a rear side of the container frame to define a holding length between the container holders, wherein the holding length is larger than an upper span between two upper ends of the inclination arms and is smaller than a lower span between two lower ends of the inclination arms, such that the container holders are adapted for self-adjustably holding along the two
10 inclination arms respectively at a position that the holding length matches with a transverse distance between the two inclination arms so as to substantially hold the detachable container at the golf cart.
